Protein

Each year the Institute makes available a number of protein samples in cooperation with various agencies of health control. Samples are obtained by means of various methods and after the testing by both the Institute and the Bureau in accordance with standard methods and procedures. This report summarizes the results of the 1977 program.

I. Introduction

During July and August, 1983, personnel from the Materials Bureau Chemical Laboratory Section obtained twenty-one samples from fourteen suppliers of asphalt cement. These samples represented many of the sources which had supplied material to the Department during the 1983 construction season including Normal, Canadian, Mid-Continent, Bos Can, Mexican and Venezuelan crude sources.

At the time of sampling, the twenty-one samples were split into two parts. One part was given to the asphalt supplier while the other was returned to the Bureau's Laboratory. All tests were conducted in accordance with the applicable AASHTO test procedure.

Two standard test report forms and one sample identification form were provided by the Bureau for recording sample information and all test results. Each supplier submitted the test results to the Bureau for review and incorporation into this report.

II. Sample Information

A. The distribution of the samples by grade was as follows:

<u>Grade</u>	<u>Number of Samples</u>
Flux	3
AC-5	2
AC-15	3
AC-20	8
85/100	5

B. The supplier, location, crude source and lot numbers are tabulated below.

<u>Supplier</u>	<u>Location</u>	<u>Flux</u>	<u>Crude Source</u>
Chevron	Perth Amboy	-	Bos Can - Maya
Marathon	Tonawanda	13	Mid-Continent
United Refining	Warren, PA	-	Canadian & Mid Continent

<u>Supplier</u>	<u>Location</u>	<u>AC-5</u>	<u>Crude Source</u>
B.P. Petro Canada	Oakville, Ont.	51/58	Canadian
United Refining	Warren, PA	6	Mid-Continent

<u>Supplier</u>	<u>Location</u>	<u>AC-15</u>	<u>Crude Source</u>
B.P. Petro Canada	Oakville, Ont.	107/108	Canadian
Marathon	Tonawanda	15	Mid-Continent
United Refining	Warren, PA	11	Canadian

<u>Supplier</u>	<u>Location</u>	<u>AC-20</u>	<u>Crude Source</u>
Arco	Philadelphia	31	Normal
Chevron	Perth Amboy	16	Bos Can
Cibro	Albany	21	Bos Can
Exxon	Linden	10	Normal
Monoco	Pittsford, NY	2	Bos Can
Parco	Stamford, CT	24	Normal
Petro Canada	Montreal, Que.	1	Mex. and Venez.
West Bank	Perth Amboy	5	Bos Can

<u>Supplier</u>	<u>Location</u>	<u>85/100</u>	<u>Crude Source</u>
B. P. Petro Canada	Oakville, Ont.	107/108	Canadian
Esso Canada	Montreal, Que.	1	Can. and Mex.
Gulf Canada	Montreal, Que.	2	Mexican
Petro Canada	Montreal, Que.	7	Mex. and Venez.
Shell Canada	Montreal, Que.	-	Eastern and Canadian

Asphalt Cement Monitor Program

III. Test Performed

A. Tests required by Department of Transportation Specification: (all tests not required on all items of asphalt cement)

1. Viscosity @ 140°F, Absolute, (AASHTO T202)
2. Viscosity @ 275°F, Kinematic, (AASHTO T201)
3. Penetration @ 77°F, (AASHTO T49)
4. Ductility @ 39.2°F, (AASHTO T51)
5. Flash Point, Cleveland Open Cup, (AASHTO T48)
6. Solubility in Trichloroethylene, (AASHTO T44)
7. % Loss on Thin Film Oven Test Residue, (AASHTO T179)
8. Penetration @ 77°F on Thin Film Oven Test Residue (AASHTO T49)
9. Penetration @ 77°F Ratio (% of Original) between the Thin Film Oven Test Residue and the Penetration @ 77°F on the original sample
10. Viscosity @ 140°F, Absolute on Thin Film Oven Test Residue (AASHTO T202)
11. Ductility @ 77°F on Thin Film Oven Test Residue (AASHTO T51)

B. Additional tests not required by Department of Transportation Specifications:

1. Penetration @ 39.2°F (AASHTO T49)
2. Penetration Ratio: 39.2°F/77°F
3. Ductility @ 77°F, (AASHTO T51)
4. Specific Gravity @ 77°F (AASHTO T228)
5. Softening Point, Ethylene Glycol (AASHTO T53)
6. Viscosity @ 275°F, Kinematic, on Thin Film Oven Test Residue (AASHTO T201)
7. Ductility @ 60°F on Thin Film Oven Test Residue (AASHTO T51)
8. Viscosity @ 140°F, Absolute, Ratio, between viscosity @ 140°F, Absolute on Thin Film Oven Test Residue Sample and the original sample.
9. A Settling Test to Evaluate the Relative Degree of Dispersion of Asphaltenes.
10. Chemical Analysis of asphalt cement.

C. A Penetration Viscosity Number (PVN) and a Penetration Index Number (PIN) has been computed for each asphalt cement sample.

IV. Test Data and Sample Identification Forms

On the following pages are the Standard Test Report and Sample Identification Forms used for this project.

VI. Summary of Test Results

Test results for all twenty-one asphalt cement samples met New York State Department of Transportation Specification requirements. The following exceptions are noted below:

- A. Exxon, Linden, AC-20, Lot 10, Normal Crude
penetration at 77°F, 58
Specification Requirement 60 to 100
meets Substantial Compliance Limits
- B. United Refining, Warren, PA, AC-5, Lot 6, Mid-Continent Crude
penetration at 77°F 94
Specification Requirement 120 to 200
does not meet Specification Requirement or Substantial Compliance Limits

viscosity at 140°F, Absolute 805 poises
Specification Requirement 400 to 600
does not meet Specification Requirement or Substantial Compliance Limits
- C. Shell Canada, Montreal, Que., 85/100, Lot -, Eastern and Canadian Crude
penetration at 77°F 83
Specification Requirement 85 to 100
meets Substantial Compliance Limits

VII. Test Results

On the following pages is a tabulation of all test results. The column headed by the name of the test contains the test result determined by the Materials Bureau. The column headed by "Comparative Results" contains the test result provided by the supplier for the test indicated in the column immediately to the left.

* RESULTS NOT GIVEN									

Only one supplier submitted Asphalt Composition Analysis Results to the Materials Bureau.

Petro-Canada, Montreal, Que. Ac-20 and 85/100

Comparison test results are noted as follows:

Asphalt Composition Analysis

	<u>AC-20</u>	
	<u>Materials Bureau</u>	<u>Petro-Canada</u>
%Asphaltenes,	17.0	20.2
%Saturates,	11.9	16.2
% Naphthene Aromatics	28.5	25.8
%Polar Aromatics	<u>36.9</u>	<u>35.3</u>

	<u>85/100</u>	
	<u>Materials Bureau</u>	<u>Petro-Canada</u>
%Asphaltenes,	15.1	13.4
%Saturates,	12.0	14.9
%Naphthene Aromatics,	27.7	24.7
%Polar Aromatics,	<u>38.9</u>	<u>42.1</u>

VIII. Statistical Analysis of Test Results

The mean, range and standard deviation were determined for the number of samples tested in each grade of asphalt cement. For each test, this statistical information has been determined separately for the Materials Bureau results and when applicable, the comparable results submitted by the supplier.

A. Absolute Viscosity @ 140°F (Poises)

1. Materials Bureau

	FLUX	AC-5	AC-15	AC-20	85/100
No. of Samples	<u>3</u>	<u>2</u>	<u>3</u>	<u>8</u>	<u>5</u>

T. Penetration Viscosity Number, (PVN)

The penetration viscosity number, PVN, is an indicator of the temperature susceptibility of asphalt cements. Lower PVN indicates greater temperature susceptibility. It is suggested that an asphalt cement with a PVN less than -0.5 is temperature susceptible.

$$PVN = \frac{\text{Log } A - \text{Log } V}{\text{Log } A - \text{Log } B} \times (-1.5)$$

Where $\text{Log } A = 4.25800 - 0.79674 \text{ Log (Penetration @ } 77^\circ\text{F)}$
 $\text{Log } B = 3.46289 - 0.61094 \text{ Log (Penetration @ } 77^\circ\text{F)}$
 $\text{Log } V = \text{Log (Viscosity @ } 275^\circ\text{F, Kinematic)}$

The results indicate that most of these asphalt cements are temperature susceptible by PVN criteria.

U. Penetration Index Numbers, (PIN)

The penetration Index Number is another indicator of temperature susceptibility of asphalt cements. Large negative values of PIN indicate greater temperature susceptibility. "Typical" asphalts have values between +2 and -2.

$$\text{PIN} = \frac{30}{1 + 90 \text{ PTS}} - 10$$

PTS = Penetration Temperature Susceptibility

$$\text{PTS} = \frac{\text{Log } 800 - \text{Log (Penetration @ } 77^\circ\text{F)}}{\text{Softening Point } (^\circ\text{F)} - 77^\circ\text{F}}$$

V. A Settling Test to Evaluate The Relative Degree of Dispersion of
Asphaltenes by

H. Plancher) Laramie Energy Technology Center

The asphaltene settling test is used to evaluate the relative degree of dispersion of asphaltenes from paving asphalts. This test distinguishes differences in asphaltene settling times of asphalts in their hexane-maltene solutions. The test involves digesting asphalt in n-hexane, transferring the contents into a graduated cylinder and measuring the time required for the asphaltene meniscus to settle to the 25 ml. mark of a 50 ml. cylinder. Slower settling times indicate a greater degree of dispersion of the asphaltenes and thus a more compatible asphalt, which in turn is considered to be an important property that contributes to asphalt durability. The test is extremely sensitive to changes in asphalt composition. Time is reported in minutes.

W. Asphalt Composition Analysis, by Liquid Chromatographic Separation and Densimetric Characterization

(Proposed) 1983 Annual ASTM Standards, Section 4,
Volume 04.03, pages 792 to 799.

The purpose is to separate the four generic fractions present in asphalt. These fractions are saturates, naphthene aromatics, polar aromatics, and asphaltenes. The relative amount of each fraction plays a role in determining the physical properties of the asphalt. These properties include viscosity, ductility, softening point and temperature susceptibility.

The procedure follows:

The percent asphaltene is determined by dispersing the asphalt in n-heptane and refluxing. The insolubles are the asphaltenes.

The remaining three fractions are determined by absorbing the deasphaltened n-heptane solution on a calcined alumina chromatography column and eluting (removing) each fraction with a different solvent. Saturates are eluted with n-heptane. Naphthene aromatics are eluted with toluene. Polar Aromatics are eluted with 50/50 toluene - methanol solution, followed by trichloroethylene. The solvents are then evaporated and weight percentages of each fraction with respect to the original asphalt sample are determined.
